PROTOTYPE

CLIENT GUIDE 02

The prototype website

A walk through every page, in the order of the menu

Prepared by Technext for EnergieBee · 26 October 2026 · pictures show the real UK home's data

THIS WEBSITE IS A PROTOTYPE. A working model built to prove the ideas, not a finished product.

- The pictures show **one real UK home** (12 to 26 October 2026). Account numbers, meter numbers, the inverter login and map coordinates are hidden.
- It was built and tested for one home. There is **no sign-in**. France and the Netherlands have no real data yet.
- It **shows and explains** energy. It does **not** yet decide when to charge a battery or heat a house, and it cannot control any device.

What it is

A **dashboard for a home's energy**, like a car dashboard. It shows what the solar panels made, what the house used, what the battery did and what it all cost. Its special feature: **every number can show its evidence**, back to the original file the company sent.

The pages, in menu order

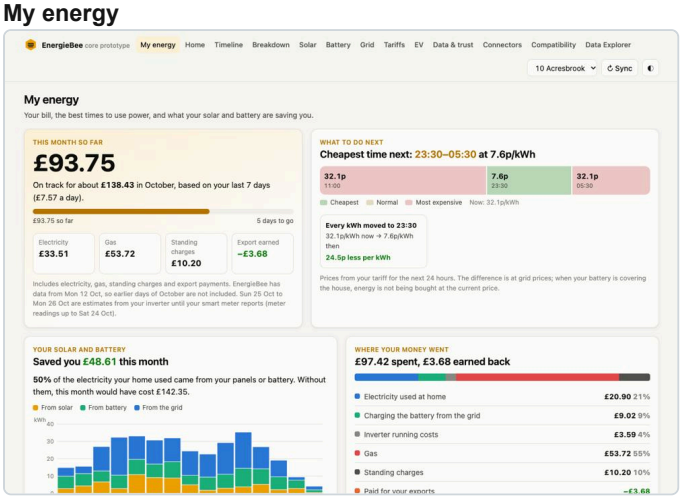

Each page answers one question.

Page	The question it answers
My energy	How much have I spent this month, and when is power cheapest next?
Home	What is the home doing right now, and what is coming in the next day?
Timeline	What did every source do, one row each, over time?
Breakdown	Who made the energy, who used it, and what did each kWh cost?
Solar	Is the sun doing its job? (output against the forecast)
Battery	How full is the battery, and is it worth it?
Grid	What did I buy from, and sell to, the grid?
Tariffs	What are my rates and taxes, and would another tariff have been cheaper?
EV	What does charging the car cost? (For this home the page says car charging is not measured yet.)
Data & trust	Where does each number come from, and can I trust it?
Connectors	Which companies and feeds are plugged in?
Compatibility	Is the database ready for the future battery and heating helpers?
Data Explorer	How exactly was this number worked out? (the detective's desk)

Take the tour

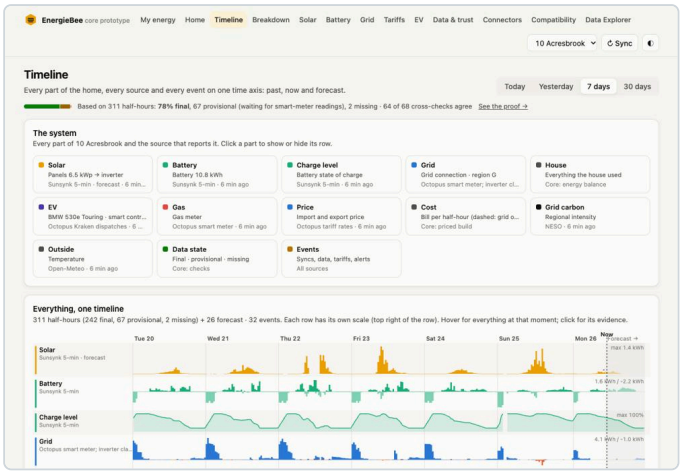

Most pages have **Today, Yesterday, 7 days, 30 days** buttons at the top right (not My energy, Connectors, Compatibility or the Data Explorer). These pictures use "7 days".

My energy

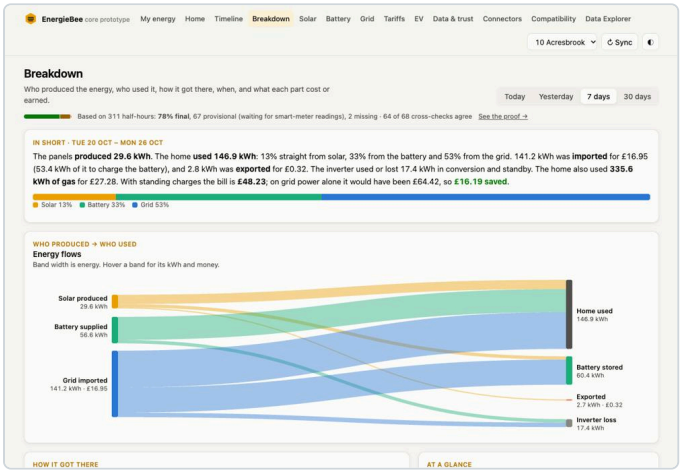

Look at the money total and the "cheapest time next" bar. **Try this:** find the cheapest time to use power next.

Timeline

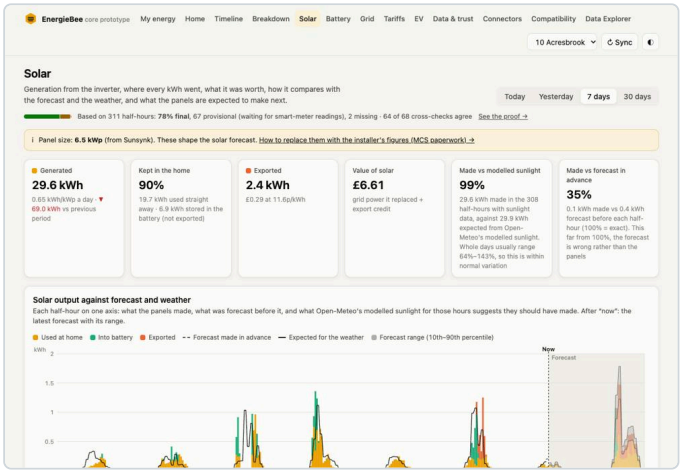

One row per source, time running left to right. **Try this:** click a time box to see its evidence.

Breakdown

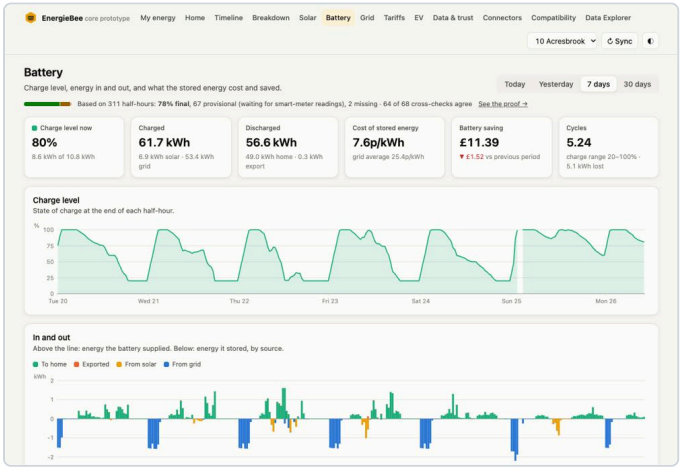

The left shows where the energy came from, the right where it went. A fatter band means more. **Try this:** find the solar-to-battery band.

Solar

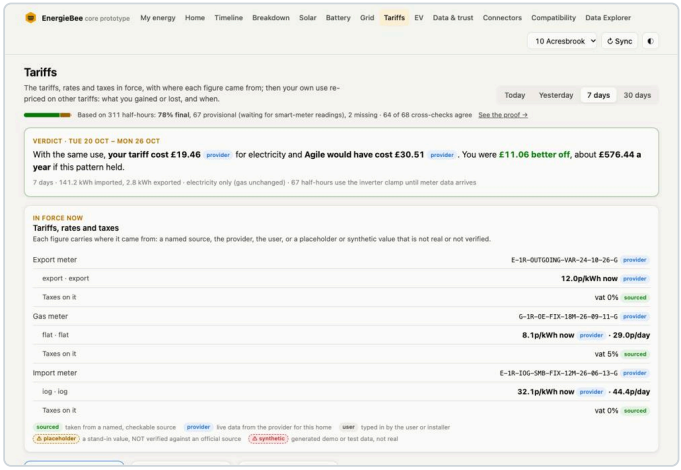

Solar output next to the forecast and the weather. **Try this:** find the sunniest day.

Battery

The charge level through the days, and what went in and out. **Try this:** find when it charges from the grid.

Tariffs

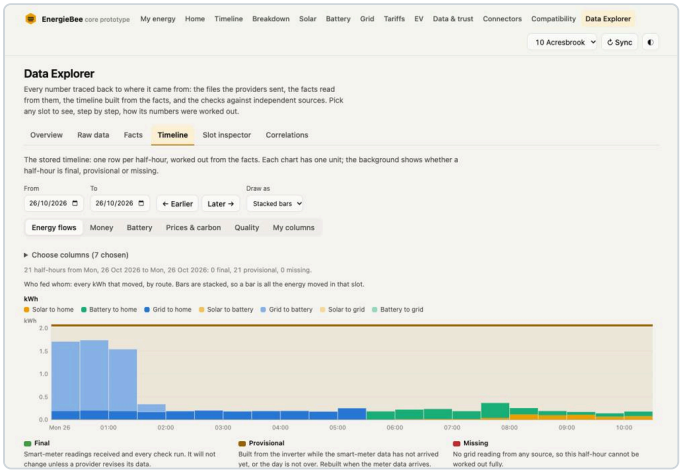

Your rates and taxes, each with a label saying where it came from, and a comparison with another tariff. **Try this:** hover a label.

The Data Explorer: the detective's desk

For anyone who asks **"but how do you know?"** Six tabs, from the files to the sums:

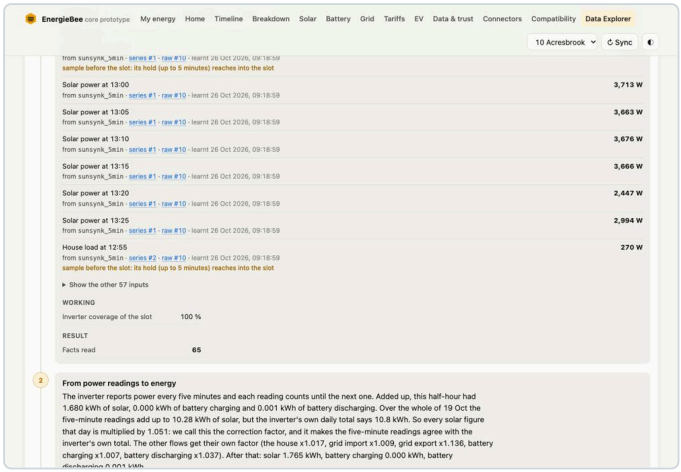

1. **Overview.** How much data there is and how complete each day is. A button checks the whole period.
2. **Raw data.** The original files the companies sent. Open one to see what the numbers inside it became.
3. **Facts.** The diary lines for any measurement, with older versions shown as hollow dots.
4. **Timeline.** The finished boxes of time. Click one to open it in the next tab.
5. **Slot inspector.** For one box: the sums, step by step, in plain words, checked against the original.
6. **Correlations.** Do two things move together, for example price and import?

Timeline tab

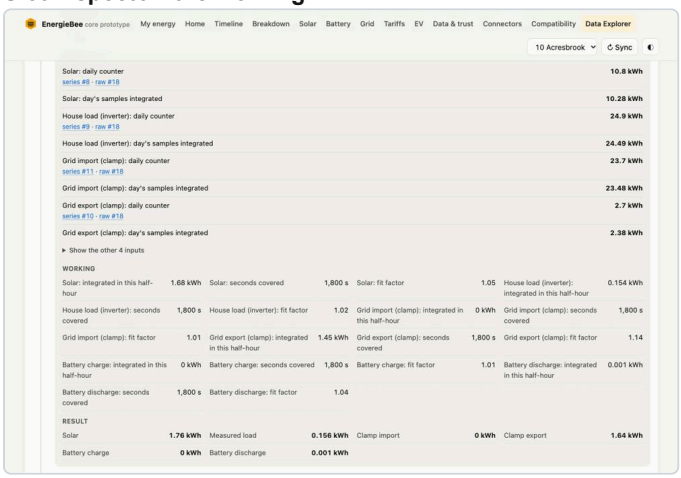

Pick a day and some columns. The background shows which boxes are final, waiting or missing.

Slot inspector: the inputs

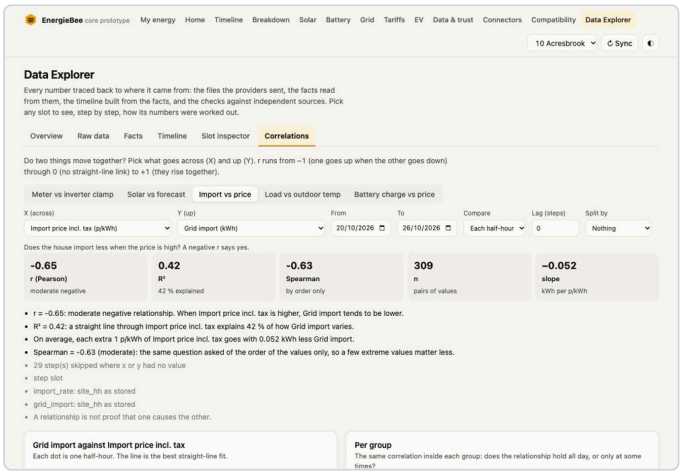

Step 1 lists the readings in the box, with their source and when we learned them.

Slot inspector: the working

The sums, in words, including how the readings are matched to the inverter's daily total.

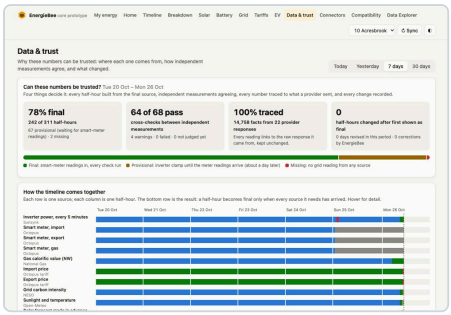

Correlations tab

A plain sentence says how strong the link is, and warns when there are too few points.

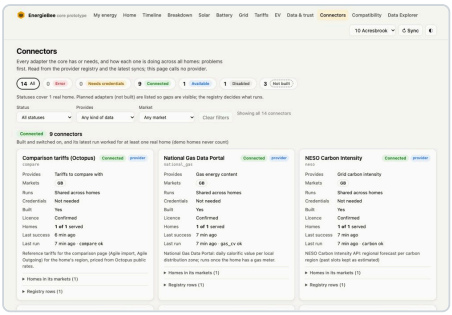

Three pages that show the evidence

Data & trust

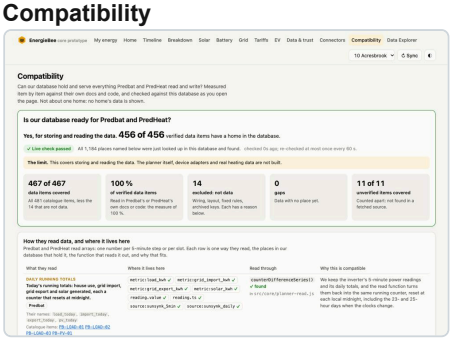

How complete each day is, and whether independent measurements agree.

Connectors

Every company or feed, and whether it is connected, available or not built.

Compatibility

A live check that the database has a place for what the future helpers need.

Three things to try

1. **Why did this half-hour cost this much?** Data Explorer, Timeline tab, click a row. Read the price step.
2. **Can I trust a number?** Open Data & trust. Then, in the Data Explorer, press the check button on the Overview tab.
3. **Is the sun doing what the forecast said?** Open Solar. Then Data Explorer, Correlations, "Solar vs forecast".

What the labels mean

Label	Meaning
final	Everything needed is in (with a smart meter, its official reading).
waiting	The meter has not reported yet, or the day is not over. The solar box fills in. (The website says *provisional*.)
missing	No data. We never invent it.
sourced, provider	From a named source or a live company feed.
placeholder	A stand-in number that has not been checked.
pass, warn, fail, skip	A double-check agreed, nearly agreed, disagreed, or could not run.

What to expect

- The data **refreshes every 10 minutes**. A brand-new start takes a minute or two to load about 2 weeks.
- It works for the **real UK home**. France and the Netherlands have no real data yet.
- France and the Netherlands have **no tax rules loaded yet** (the numbers used in tests are placeholders). One UK VAT rate still needs checking.
- **Not built yet:** battery and heating decisions, controlling devices, sign-in.

How to run it

Put the login details in a file called `.env`, run `docker compose up -d` and open `http://localhost:8080`.
